Executive Summary

Since the arrival of Steve Spurrier in Columbia, “Florida usually beats Carolina” has eventually become “the Gamecocks usually beat the Gators.” The reverse is true in K-12 education.

In 1999, South Carolina students led Florida students in performance on a number of national educational tests, including NAEP, the National Assessment of Educational Progress.

But for 2003-2011, in combined Math and Reading NAEP scores, Florida was first with a 54 point improvement and South Carolina was last with a 44 point decline (page 7).

Question: How did Florida leapfrog South Carolina in such a short period of time?

Answer: transformation through comprehensive reform.

Here are Florida’s transformational reforms under former Governor Jeb Bush:

- Curtailing social promotion (p. 6). Florida students were promoted to the next grade when they were ready, not when they had completed 180 days of seat time.

- Providing school choice (p.7). Florida parents were given the opportunity to select the school that fit their child best and the dollars followed the child so that public schools were not harmed.

- Grading schools, focusing on the lowest 25% (p.9-11). Florida schools were graded on how well they performed with their most challenged students. Grading increased focus and focus increased performance.

- Leading the nation in technology (p.5). Florida bridged the digital divide with aggressive development of online programs.

- Concentrating on reading (pp.1-4). Florida embraced the importance of reading to all academic success and eliminated barriers to progress, even for the disadvantaged.

- Eliminating barriers to great teaching (p.6). Florida achieved greater access to the abilities of its citizens who had the ability and life experience to make great teachers but were unwilling to follow complicated and redundant certification processes.

Forum Bottom Line: South Carolina students can regain their pre-1999 lead over Florida if South Carolina leaders have the will to enact similar reforms.
“Reform is never finished and success is never final. A perpetual cycle of reform will lead to sustained improvement for the long-term.”

— Former Florida Governor Jeb Bush

FLORIDA LEADS THE WAY ON K-12 EDUCATION REFORMS

On October 20, 2012 the University of South Carolina Gamecocks faced off with the Florida Gators in their annual college football showdown. University of South Carolina head coach Steve Spurrier won the Heisman Trophy as a player at the University of Florida and won a national championship as Head Coach of the Gators. The “Ole Ball Coach” has managed to defeat his former team more than once. The eyes of the nation tuned in to the drama in Gainesville in October to see if he can do it three times in a row, but victory eluded Spurrier and his players this year.

Meanwhile, less visible but more important competitions go on between South Carolina and Florida. Both states compete, not just against each other but also against the world, to provide a business climate that encourages economic development, growth, and employment. A critical component of that competition involves the quality of the public school systems in each state. In this competition, South Carolina has fallen behind Florida. The clock never stops in this game, however, giving South Carolina the opportunity to catch up and potentially even to exceed Florida’s success.

Please note from the outset that the purpose of this work is decidedly not to claim that Florida has achieved K-12 Nirvana and/or that all South Carolina schools are terribly underachieving. Neither of these things is true. This work instead intends to detail the reforms that substantially improved learning in Florida, taking the state off the bottom of national comparisons. Readers should view these reforms as a baseline for action and seek to improve K-12 outcomes.

What Florida has done, South Carolina could, in time, exceed.

THE FLORIDA REFORM AGENDA

Beginning in 1999, the Florida state legislature began adopting far-reaching education reforms. These reforms included grading schools with easily comprehensible labels—letter grades A, B, C, D, and F—and expanding school choice by creating a tax credit scholarship program and the nation’s largest private choice scholarship program. Florida also became the nation’s leader in virtual education—offering classes online through the Florida Virtual School. In addition, the state’s lawmakers curtailed the social promotion of illiterate elementary students, reformed reading instruction, and created multiple paths for alternative teacher certification. As you will see, the results, specifically from national reading exam data, speak volumes.

The National Assessment of Educational Progress (NAEP) tests random samples of students in the states. Both South Carolina and Florida have participated in the main NAEP 4th and 8th grade reading and math exams since the early 1990s.

An examination of the progress on those exams reveals that both states have achieved gains on all four
tests. Florida’s math progress has been somewhat better than South Carolina’s. Florida’s combined gains on math exceed those of South Carolina by about 20%. Fortunately, both states have exceeded the national average for improvement in math during this period.

Despite these above average rates of improvement, both states were either near or slightly below the national average on the math exams in the most recent NAEP-2011. Both states stood well below the national averages on 4th and 8th grade math in the early 1990s, so the progress is welcome. However, neither South Carolina nor Florida can feel satisfied with having closed the gap with the national average in math when one considers how poorly American average mathematics achievement level compares to our international competitors—more progress is needed.  

Achievement trends between South Carolina and Florida diverge much more starkly in reading. Measuring from the earliest available statewide NAEP reading score from each state in 1992 to the most recent exam in 2011, Florida’s combined 4th and 8th Grade reading gains are more than two and a half times larger than South Carolina’s.

Florida has radically improved reading performance, especially among disadvantaged students. South Carolina has the opportunity to learn from Florida’s experience and achieve a larger and faster increase in literacy scores.

Florida has experienced a number of positive academic trends since the late 1990s. Between 1998 and 2010, for instance, the percentage of Florida students graduating from high-school increased from 67% to 87%. In large part enabled by this increase in high school graduation rates, the percentage of Florida students pursuing higher education increased from 50% in 1997-98 to 68% in 2008-09. During this same period, the number of Black and Hispanic students passing one or more Advanced Placement exams more than tripled.

A key strategy in improving high-school outcomes in Florida, however, involved teaching the most basic skills at the elementary level. Students who fail to master basic literacy skills at the developmentally critical age often struggle to keep up as grade level material advances with each ascending grade. Florida’s K-12 reformers therefore focused on improving early childhood reading.

In November of 2011, the National Center for Educational Statistics released the reading exam results of the 2011 National Assessment of Educational Progress—also known as “The Nation’s Report Card.” Of all the NAEP exams, education officials pay the closest attention to the fourth-grade
reading exam. Literacy acquisition involves developmentally crucial periods. Reading is broadly similar to learning a foreign language in that it is easier to do when you are young. Educators summarize this phenomenon with an expression: In grades K-3, you are learning to read. After third grade, you are reading to learn. If you cannot read, you cannot learn.

NAEP presents data both as average scores and also as levels of achievement. Figure 1 presents the scale scores from NAEP’s fourth-grade reading exams for both South Carolina and Florida between 1998 and 2011. Florida’s reforms began the year after the 1998 NAEP; prior to this time the state’s reading scores had been low and flat. For the charts presented in this report, bear in mind that a 10-point gain equals approximately a grade level’s worth of learning such that, all else being equal, we would expect a group of 5th graders taking the 4th grade NAEP reading test to do about 10 points better than a similar group of 4th graders.

Notice that in 1998, the year before the Florida reform efforts, South Carolina students outscored the average student score in Florida by 3 points on the NAEP reading exam. Both South Carolina and Florida’s score that year was near the bottom of the rankings. In 2011, however, the average Florida student scored 10 points higher than the average South Carolina student—almost a grade level higher.

The scale of the differences between South Carolina and Florida can also be compared by achievement levels. NAEP uses four different achievement levels: Below Basic, Basic, Proficient and Advanced. Figure 2 presents the achievement levels for low-income students in both states. In 1998, the average South Carolina low-income student was neck and neck with their peers in Florida in terms of reading achievement, but with both states scoring abysmally low. The percentage of South Carolina low-income students scoring “Basic or Better” (Basic, Proficient and Advanced) increased from 35% in 1998 to 48% in 2011.

This was a welcome improvement in South Carolina, but one which still saw a majority of South Carolina low-income students functionally illiterate. During the same period, Florida’s low-income students scoring “Basic or Better” surged from 37 percent to 62 percent. This is still well short of where Florida policymakers and educators would like to be, but also constitutes a very large improvement.

Figure 3 compares the academic progress of Florida’s Hispanic students to that of all students in South Carolina. Florida Hispanics outscored South Carolina Hispanics by 12 points on the 2011 NAEP.

In 1998, before the reforms, Florida’s Hispanics scored
approximately one grade level behind the average South Carolina student. While the South Carolina average nudged forward a bit, Florida’s scores surged over time.

Florida’s Hispanic students outscored statewide averages other than that of South Carolina. Hispanic students in Florida have made such strong progress that they now outscore the statewide averages of 21 states and the District of Columbia, as shown in Figure 4.

The late Daniel Patrick Moynihan once joked about the racial achievement gap by noting that performance on NAEP correlates perfectly with proximity to the Canadian border. States wishing to improve their scores would simply have to “move closer to Canada.”

One can hold little doubt that the scholarly Senator would be quite pleased to see Hispanic students holding their own and exceeding statewide averages.

Florida’s Black students have been closing the gap with the statewide average score in South Carolina as well. Figure 5 compares the scores of Black students in Florida and South Carolina. In 2011, Florida’s Black 4th graders were reading at an average level that we would reasonably expect for 5th graders in South Carolina.

Before the 1999 reforms, South Carolina’s Black students outscored Florida’s by a considerable margin. Despite some improvement in the South Carolina scores, today they find themselves behind Florida by an even wider margin.

Figure 6 compares the fourth-grade reading scores of all students in South Carolina to those of Florida’s.
students whose family incomes make them eligible for the federal Free and Reduced-Price Lunch program, which officials use as a poverty metric within the public school system. In 2010, a family of four could earn no more than $40,793 per year to qualify for a reduced price lunch. However, of those who qualified nationwide for Free and Reduced Price Lunch, 80 percent of children were from families who qualified for free lunch, which has a maximum family income of $28,665 for a family of four.

Bear in mind that the United States Census Bureau estimated the median family income for a South Carolina family to be $51,704 in 2010—an income level far higher than the average for Free and Reduced lunch children. The fact that Florida’s low-income children have exceeded statewide average scores for all students tells us something very important about demography and education: dramatic improvement for disadvantaged students is possible.

**FLORIDA’S COMPREHENSIVE K-12 REFORMS**

Florida did not achieve these results with any single reform, but rather with a multifaceted strategy. Reform highlights include:

- Florida grades all district and charter schools based upon overall academic performance and student learning gains.
- Florida earns letter grades of A, B, C, D, or F, which parents easily can interpret.
- Florida has the largest virtual-school program in the nation, with more than 80,000 students taking one or more courses online.
- Florida has an active charter school program, with 445 charter schools serving more than 179,000 students.
- The Step Up for Students Tax Credit program assists 23,000 low-income students in attending the school of their choice.

CURTAILING SOCIAL PROMOTION

Ensuring that third-grade students are able to pass the FCAT reading exam to enter fourth grade is the focus of Florida’s policy curtailing social promotion. In 2001, Florida schools retained 4.78 percent of 3rd graders. After the enactment of the policy described below, 8.89% of Florida 3rd graders repeated in the 3rd grade in the 2002-03 school year. This percentage of retained students proceeded to fall through the decade as 3rd grade reading scores improved, reaching 4.9 percent in 2008-09.

Empirical evidence suggests that ending social promotion has had a positive impact on students’ performance. Dr. Jay Greene and Dr. Marcus Winters of the University of Arkansas evaluated the results of the social promotion policy after two years. They reported that “retained Florida students made significant reading gains relative to the control group of socially promoted students” with the academic benefit increasing after the second year. “That is, students lacking in basic skills who are socially promoted appear to fall farther behind over time, whereas retained students appear to be able to catch up on the skills they are lacking.”

Beyond the likely benefit of increased remediation, the threat of being retained also creates a strong incentive for children to improve their studies so they can proceed to the next grade with their peers.

Better still, schools increased parental involvement for struggling readers by developing Home Reading Plans, and began earlier testing and intervention strategies. Since the year before the retention policy came into effect, the percentage of Florida students scoring low enough to qualify for retention has fallen by 40 percent. More Florida children, in short, are learning how to read during the developmentally critical period. The students at the bottom proved the biggest winners from Florida’s no-nonsense reforms.
SCHOOL CHOICE: ACCOUNTABILITY TO PARENTS

Florida’s school choice programs allow low-income and special-needs children to receive assistance to attend private schools of their parents’ choosing. Charter schools, meanwhile, are open to all students; however, students who are unhappy with their experience in public schools are more likely to transfer into charters. Likewise, students struggling in traditional schools are the most likely to transfer under Florida’s private choice programs.

Florida has about four times the population of South Carolina, but approximately ten times the number of charter school students. Empirical research finds that Florida’s choice programs contribute to the improved performance in its public schools.

A Manhattan Institute study, published in 2003, evaluated Florida’s A+ Plan and the effect it had on the state’s public education system—specifically, the effects from competition caused by school choice.

The A+ Plan provided Opportunity Scholarships to students in chronically failing public schools, that is, public schools that earned two F grades in any four-year period. The study found that public schools facing “competition or the prospect of competition made exceptional gains on both the FCAT and the Stanford-9 test compared to all other Florida public schools and the other subgroups.”

In 2007, the Urban Institute published a similar analysis of the A+ Plan and its impact on Florida’s public schools. The authors found that after school grading began, student achievement improved in schools graded F at an accelerated rate. Importantly,
the authors discovered that reforms undertaken by the low-performing public schools contributed to the improvement: “[W]hen faced with increased accountability pressure, schools appear to focus on low-performing students, lengthen the amount of time devoted to instruction, adopt different ways of organizing the day and learning environment of the students and teachers, increase resources available to teachers, and decrease principal control.”

A 2008 study, also by Dr. Jay Greene and Dr. Marcus Winters of the University of Arkansas, found that competition caused by another school choice program spurred positive academic gains in Florida’s public schools. The researchers evaluated the competitive effect of the McKay Scholarships for Students with Disabilities Program on public schools. They report that “public school students with relatively mild disabilities made statistically significant test score improvements in both math and reading as more nearby private schools began participating in the McKay program.”

Multiple testing experiments evaluating the impact of private school voucher programs in other communities have shown that students exercising choice improve academically, and none have found any evidence of academic harm. Moreover, additional evaluations have found that increasing competition through school choice options (both private school choice and charter schools) leads to improvement in traditional public schools.

A comparison between the academic trends for children with disabilities in Florida and South Carolina is telling. Figure 8 compares the combined NAEP learning gains on the four major exams (4th and 8th grade Reading and Math) for the entire period in which all states took the NAEP tests (2003-2011).

The formula for calculating the gains in Figure 7 simply was to subtract the 2003 scores from the 2011 scores for children with disabilities on each of the four NAEP exams. Florida leads the way with a net gain of 54 combined points. Averaged across four exams, this means that the average Florida child performed more than a grade level higher per exam in 2011 than children with disabilities had performed in 2003.

Sadly, South Carolina suffered the nation’s largest decline in scores for children with disabilities during this period with scores 44 points lower in 2011 than they had been in 2003. Figure 8 provides data showing what this means in terms of proficiency on the NAEP 4th grade reading exam.

Florida has provided school choice to all children with disabilities for over a decade. If there is any evidence that this has harmed the performance of the special needs students remaining in the public school system, let’s say that it is quite difficult to find. Like all other students, Florida’s children with disabilities have benefitted from a variety of policy interventions in addition to parental choice.
Only a small percentage of eligible students use the McKay Scholarship directly (around 5 percent of the total) but 100 percent of Florida students with disabilities have access to the program if their parents feel they really need it. School choice empowers parents to make the best possible decisions for their children. South Carolina meanwhile should conduct a serious inquiry into why the Palmetto State demonstrates such negative trends among children with disabilities. Many states have shown strong academic gains among their children with disabilities and South Carolinians should expect nothing less.

WHY HAVE FLORIDA’S DISADVANTAGED STUDENTS ADVANCED SO STRONGLY?

Florida’s reformers pushed forward a multifaceted strategy, which has benefited a wide range of students in that state. Notice, however, that disadvantaged students have gained the most from these reforms. Why?

Let us take the reforms one at a time. Florida’s private school choice programs allow children with disabilities and low-income children to receive assistance to attend private schools of their parents’ choosing. Charter schools, public schools of choice, are open to all students; however, students unhappy with their experience in public schools are more likely to transfer. Who are the big winners from public and private school choice? Those most poorly served by traditional district schools.

The same goes for Florida’s third-grade retention policy. This earned promotion policy may seem cruel to some at first blush; however, rigorous research demonstrates that it is only cruel to those students who are exempted from the retention policy.

In 2006, approximately 29,000 third-grade students failed the reading portion of Florida’s Comprehensive Assessment Test (FCAT).16 It is important to note, however, that Florida’s retention policy contained a number of exemptions. An analysis by Manhattan Institute scholars compared the academic progress of retained students to two groups of similar students (those who barely scored high enough to avoid retention and those who scored low enough for retention but received an exemption17).

The Manhattan team reported that after two years “retained Florida students made significant reading gains relative to the control group of socially promoted students.”18 The researchers found that the academic benefit increased after the second year: “That is, students lacking in basic skills who are socially promoted appear to fall farther behind over time, whereas retained students appear to be able to catch up on the skills they are lacking.”19

The retained students learned how to read, whereas the promoted students continued to fall behind grade level, which is the normal academic trajectory for children failing to learn basic literacy skills. Once again, the students at the bottom proved the biggest winners from Florida’s aggressive reforms.

Consider, also, alternative teacher certification. Allowing more people with degrees to demonstrate content knowledge and join the teaching profession expands the possible pool from which to recruit high-quality teachers. Inner-city children suffer
the most from the shortage of high-quality teachers, as the system favors suburban systems in recruiting and retaining highly effective teachers. Thus, inner-city children gain the most from reducing the shortage.

Also, Florida’s system of accountability grades schools A, B, C, D, or F, which many complained was unfair to schools with predominantly minority student bodies. A small but noisy group continues to bemoan the grading method, claiming that it is unfair to teachers and to students.

It would prove difficult to be any more tragically mistaken, or more willfully ignorant. To be sure, rating schools A through F in Florida represents tough medicine: The state called out underperforming schools in a way that everyone could instantly grasp. Tough love is still love: Florida’s schools improved, both on the state FCAT and on NAEP (again, a source of external validation for the state exam).

Did Florida’s D and F schools wither under the glare of public scrutiny? Quite the opposite: Those schools focused their resources on improving academic achievement. Made aware of the problems in their schools, communities rallied to the aid of low-performing schools. People volunteered their time to tutor struggling students. Improving student academic performance, and thus the school’s grade, became a focus.

In 1999, 677 Florida public schools received a grade of D or F, and only 515 an A or B. Figure 9 tracks the trend for those sets of grades, and critically, the four arrows represent a raising of the standards which made it more challenging to receive a high grade. In 2010, only 181 schools received a D or F, while 2044 schools received an A or B.

But was this just an illusion? That is, was progress achieved by lowering the “cut score” of the state FCAT exam? (The “cut score” is the minimum passing score students can achieve.) In a word, no. Florida did not make the FCAT easier to pass, maintaining a constant standard. Harvard Professor Paul Peterson has demonstrated that Florida has indeed maintained the integrity of the FCAT.20

Florida’s students have improved both on the FCAT and on the NAEP. Importantly, Florida’s improvement on NAEP also dispels the concern that schools are “teaching to the test.” NAEP exams have a high degree of security, and federal, state, and local authorities do not use them to rate schools or teachers. Teachers lack both the ability and the incentive to teach to the questions on NAEP exams.

Florida’s schools improved their rankings because their students learned to read at a higher level and became more proficient at math. Those who wanted to continue to coddle underperforming schools, while perhaps well intentioned, were effectively in favor of consigning
Transformation: What South Carolina Can Learn From Florida’s K-12 Reforms
January 2013

11

Palmetto Promise Institute

hundreds of thousands of Florida children to illiteracy.

In summary, those with the least, consistently gained the most from Florida’s reforms. This is perhaps clearest of all when one examines the formula for assigning letter grades to schools.

Florida determines schools’ grades in equal measure between overall scores, and gains over time. In addition, the state divides the gain part of the formula equally between the gains for all students, and the gains for the 25 percent of students with the lowest overall scores. The state determines these grades by the following formula—50 percent on overall scores, 25 percent based on the gains of all students, and 25 percent based upon the gains of the lowest performing students.

Notably, the bottom 25 percent of students play the biggest role in determining the grade of a school. These students count in all the categories: the overall scores, the overall gains, and the gains of the lowest-performing students.

Notice the elegance of the Florida grading system.

By way of contrast, the federal No Child Left Behind Act (NCLB) allows schools not to count subgroups depending upon the size of the group. (NCLB divides student bodies into various subgroups based upon race, ethnicity, income, disability status, etc., and requires an increasing passing threshold from each group. The exact size of the groups permissible is determined by obscure bureaucrats in state departments of education—and some exempt far larger groups of students than others.)

EXPLORING OTHER POSSIBLE EXPLANATIONS FOR FLORIDA’S GAINS

Demographic Change or Big Spending?

Several alternative explanations for Florida’s success need to be addressed. For instance, could demographic change explain some of Florida’s improvement? According to the National Center for Education Statistics, in 1998, 44.7 percent of Florida children attending public schools were minority students. During the 2008 school year, 53 percent of children were minorities. In 1998, 43.8 percent of Florida students had a family income that qualified them for a free or reduced-price lunch under federal guidelines. In 2009, Florida’s percentage had increased to 49.6 percent.21

Changes in public school funding are also an unlikely source of improvement. Spending per pupil

“those with the least gained the most from Florida’s reforms”

The Florida system is far more direct: Every school has a bottom 25 percent of students. Regardless of why those students have struggled academically, Florida’s grading method will not grant schools a high grade unless those students make progress.

Academic fatalists quickly will jump up to argue that many students simply cannot learn. Florida and the success of others in substantially improving the scores of poor and minority children should put this “soft bigotry of low expectations” into the shameful dustbin of history that it so richly deserves.

Moreover, Florida’s success in getting Hispanic and Free and Reduced-Price Lunch children to read at higher levels than the statewide average for all students in South Carolina nullifies such arguments. Bottom line: Tough love for schools works great for kids, especially disadvantaged kids. The children with the least have gained the most.
in Florida expanded at a rate slower than the national average during Governor Bush’s term in office, and remains below the national average on a per pupil basis.\(^{22}\)

Some may ask whether Florida’s cellar-dweller performance in the 1990s led to a “regression to the mean” effect, whereby improvement came relatively easily. However, most of the states such as Florida that ranked near the bottom of NAEP in the late 1990s remained near the bottom in 2011.

Florida does have some unique characteristics, including a Hispanic population comprised of a higher percentage of Cubans than most states. Could the marked improvement in Florida’s Hispanic scores be linked to relatively unique cultural characteristics? Not likely. Black and white students also made strong gains during this period. The percentage of Hispanics of Cuban origin actually declined during the period observed down to 30 percent of Hispanics in 2007.\(^{23}\)

**Artifact of Third Grade Retention?**

Could the third grade retention policy have created the appearance of gains on NAEP? Prof. Walter M. Haney of Boston College argued that Florida’s progress on fourth grade NAEP scores represented a “fraud” due to the third grade retention policy.\(^{24}\) Haney presented evidence that Florida’s retentions increased after the debut of the policy, and ascribed subsequent NAEP score increases to the fact that Florida’s worst performing readers were repeating third grade and thus were not tested in the fourth grade NAEP, inflating the fourth grade scores.

This analysis was later replicated in a “Think Tank Review Project” review performed by a group funded by the National Education Association.\(^{25}\) However, neither analysis holds up under scrutiny.

First of all, Florida’s NAEP scores improved strongly between 1998 and 2002. Gains during these years were not at all impacted by the retention policy.

A good deal of the improvement in fourth-grade reading NAEP scores has come from increases in the percentage of children scoring at the “Proficient” and “Advanced” levels. FCAT scores categorize student reading achievement from 1 to 5, and the retention policy only impacts a portion of those in category 1.

Florida demonstrated very large gains among the sort of students who were profoundly unlikely to have been reading at FCAT Achievement Level 1 in the third grade (and thus unaffected by the retention policy). The percentage of students scoring Proficient on the 4th grade reading exam increased by nearly 60% between 1998 and 2009, and the percentage scoring Advanced doubled from 4% to 8% (see Figure 10).

![Figure 10: Trends in Florida NAEP Reading Scores for Proficient and Advanced Readers](image)
Furthermore, the percentage of third graders scoring FCAT Achievement Level 1 on reading has itself been decreasing. In 2002, 27 percent of third graders scored at Achievement Level 1, but by 2009 the number had declined to 16 percent, which represents a 40 percent reduction in the pool of students eligible for retention. Likewise, the actual number of third grade students retained also declined by 40 percent between 2002 and 2007. Nevertheless, Florida’s fourth-grade NAEP scores continued to improve throughout this period.

Since the year before the retention policy came into effect, the percentage of black students scoring FCAT Achievement Level 1 on third-grading reading declined by 37 percent, and the percentage of Hispanic students scoring FCAT Achievement Level 1 declined by 45 percent, (see Figure 11).

None of these gains has anything to do with the children tested simply being a year older. In fact, the regression discontinuity analysis performed by the Manhattan Institute demonstrated that children scoring just over the retention threshold, and those scoring below it, continued to struggle with reading despite being a year older.

The third-grade FCAT data presented in Figure 14 demonstrate conclusively that an increasing percentage of Florida elementary students have been learning how to read during the developmentally critical period, grades K-3. Minority students have helped to lead the charge in producing reading gains. Best of all, black and Hispanic students have led in these enormous gains.

Before the retention policy, 41 percent of Florida’s black third graders scored FCAT Reading Achievement Level 1, in 2010, it was down to 26 percent. In the most recent testing, the percentage of Hispanic third graders scoring FCAT Reading Achievement Level 1 fell to 19 percent from 35 percent in 2002. Florida’s reforms have reduced retentions the best way possible: by teaching a growing percentage of students how to read in the early grades.

Professor Haney’s thesis would be hard-pressed to explain why 3rd grade reading scores have improved so substantially. One can only characterize the evidence that Florida students have improved literacy achievement, both at the low end (see Figure 11) and high end (see Figure 10) as overwhelming.

Class Size or Pre-school Amendments?

Florida’s voters adopted two significant education policy changes at the ballot box. In 2002, Florida voters passed a state constitutional amendment limiting class size at public schools. The limit was first
implemented based upon school district averages, and then school averages, and only came into force as an actual limit on each class during the 2010-11 school year. A detailed statistical analysis of the Florida class size reduction program found no evidence that it helped to drive academic improvement. This is unfortunate, as the Florida Department of Education has found that it has cost Florida taxpayers more than $18 billion dollars (and counting) to implement.

Florida’s preschool amendment may or may not prove to have positive long-term benefits. After voters adopted it, the Florida legislature quite sensibly enacted the program as a choice program to include public and private providers and to allow parents to choose.

“South Carolina cannot achieve global competitiveness through minor tweaks in a broken system”

The Florida preschool program also includes specific academic goals and a provision to remove underperforming providers from participation in the program. Florida’s Voluntary Prekindergarten Education Program began in the 2005-06 school year, and thus none of the students have yet reached the fourth grade to be included in the NAEP. The Florida Department of Education has released some preliminary analysis of third-grade reading scores which may indicate a sustained academic benefit to the program, but those data have yet to be subjected to a rigorous statistical analysis.

In any case, none of the NAEP gains seen in Florida before 2009 have anything to do with the Voluntary Prekindergarten Education Program, because the students have not yet reached the age of NAEP testing. In 2011, Florida’s aggregate scores did not increase from 2009 levels. A sophisticated analysis of the program will be required to establish the exact nature of its impact, but the aggregate impact of the large increase in 4th grade reading scores can safely be dismissed as minimal at best.

FORTUNE FAVORS THE BOLD IN K-12 EDUCATION REFORM

In December 2006, the New Commission on Skills and the American Workforce released a report titled Tough Choices or Tough Times. The commission included a bipartisan mix of education luminaries, including two former U.S. secretaries of education. The report warns, “If we continue on our current course and the number of nations outpacing us in the education race continues to grow at its current rate, the American standard of living will steadily fall relative to those nations, rich and poor, that are doing a better job.”

Commenting on the report, Jack Jennings of the Center on Education Policy told the Christian Science Monitor, “I think we’ve tried to do what we can to improve American schools within the current context. Now we need to think much more daringly.” These and other observers have reached an unavoidable conclusion: The traditional model of delivering public education requires a drastic overhaul, not incremental reform.

Florida’s example shows that it is possible to improve student performance by instituting a variety of curricular and incentive-based reforms, placing pressure on schools to improve both from the top down and bottom up. South Carolina’s policymakers should view Florida’s reforms as a floor rather than a ceiling in terms of their own efforts to improve education in their state.

Marc Tucker, vice chairman of the New Commission also told the Christian Science Monitor, “We’ve squeezed everything we can out of a system that was designed a century ago. We’ve not only put in lots more
money and not gotten significantly better results, we’ve also tried every program we can think of and not gotten significantly better results at scale. This is the sign of a system that has reached its limits.”

Indeed, South Carolina cannot achieve global competitiveness through minor tweaks of a broken system. Florida’s broad efforts and resulting outcomes prove this. Fortune favors the bold, and a brighter future awaits South Carolina’s students if her adults will take strong action.

South Carolina across the political spectrum should work together with educators to fiercely pursue radical improvement in literacy skills. Americans of all philosophical backgrounds agree with the notion of providing equality of opportunity to children, which starts with literacy. Those South Carolina students starting with the least have the most to gain from reform.

ENDNOTES

1 Moreover, one author of this paper hails from a state (Arizona) with larger K-12 challenges than either South Carolina or Florida.

2 American 15 year old students ranked 25th out of 34 nations in the 2009 PISA exam and below the international average for participating nations. See http://nces.ed.gov/surveys/pisa/pisa2009highlights.asp for details.

3 Passage of the No Child Left Behind Act in 2002 made participation in NAEP a precondition for receiving federal education dollars. All states began participating in NAEP beginning in 2003.

15 The NAEP created minimum inclusion standards for special needs students for the 2011 exams. Eleven states failed to meet those standards, and a handful of other states did not have samples of children with disabilities large enough for NAEP to report their scores at all. Such states have been excluded from this table. For a more complete discussion of inclusion issues, see Matthew Ladner and Dan Lips (2012) Report Card on American Education, pages 30-33 at http://www.alec.org/publications/report-card-on-american-education/.

17 Florida’s retention policy allowed students to demonstrate basic literacy skills to advance with a portfolio, and limited the number of times a student could be retained.
